INTRODUCTION

Web development is the whole process of developing and maintaining websites. Web development is a good career to choose for someone who likes to solving logical problems, building useful things, and experiment with new technologies.

Web development fundamentals require a set of skills and technologies for developing functional and visually appealing websites.

Fundamentals of web development

HTML (HyperText Markup Language)

Structure of a webpage is created using HTML. This language writes codes for the webpage which includes HTML tags for the browser to display and format images, text, and videos.

CSS (Cascading Style Sheets)

CSS is a set of rules that styles and formats the structured pages containing various text, images, videos, and other elements. It adds a more professional touch to the webpage and makes it interactive for the users.

JavaScript

JavaScript is a general-purpose programming language used for web development. JavaScript is used to write programs and implement dynamic and interactive web pages.
